4. AMENDMENTS TO THE CLAIMS.

A. A complete listing of all of the claims is not present.

A complete listing of Claim No.1 and Claim No.2 is given below.

(1) **CLAIM OR CLAIMS.**

The flying object is to made of two hollow discs welded on the circumference. High Pressure gas is generated inside the hollow portion. A number of nozzles are fixed around the circumference. The nozzles are fixed in such a manner that high pressure gas will leave tangentially to the disc. When high pressure gas leaves tangentially this force will impart a high speed rotary motion to the disc. When the speed increases and at very high speeds the disc will leave the ground and start flying at a high speed.

Claim No.1: I claim high speed revolving disc leaving the ground and taking off is the main No.1 claim and this idea is to be patented.

Claim No.2: I claim that claim No.1 can be also achieved by making the escape of the gas by a micro processor controlled valve. In this case only gas will be ejected by the valve. I claim in this case the disc will leave the ground and take off without any rotary motion.

AMENDMENTS TO THE CLAIMS. 4.

E. Claim 1 should include a status identifier.

Claim 1 has been presented previously and there is no change.
